PRACTICAL LIST

1. Construct a table Department with Dept Id as primary key, Dept name and Location name. Create a table Employee with Employee Id as primary key, Employee Name, Designation, Gender, Age, Date of Joining, Dept Id as foreign key and Salary and insert data in both the tables.
2. Extract queries using Comparison, Logical, Set, Sorting and Grouping operators to retrieve required data from the Employee table created in Question 1.
3. Write queries using aggregate functions to summarize the data from the Employee table created in Question 1.
4. Extract Query to
 - A. Display the Employee id, employee name for all employees who earn more than the average salary.
 - B. Display the employees who have the highest salary
 - C. Display all employees who belong to a particular location
5. Construct tables for the library management system which demonstrate the use of primary key and foreign key. Master table should have the following fields: Accno, Title, Author and Rate. Transaction table should have the following fields: User id, Accno, Date of Issue and Date of Return. Create a Report(Select verb) with fields Accno, Title, Date of Issue for the given Date of Return with column formats
6. Create a Student table with following fields and Constraints.
 - Regno - Primary key
 - Name - Not null
 - Marks - Check marks between 0 to 100
 - Gender - Default value of Female
 - Aadhar card number -Unique
7. Write a PL/SQL program
 - A. To check whether a given character is letter or digit.
 - B. To convert a temperature in scale Fahrenheit to Celsius and vice versa.
8. Create a program in PL/SQL
 - A. To check whether a number is prime or not using goto statement with for loop.
 - B. To print the prime numbers between 1 to 50.
9. Create a PL/SQL to update the rate field by 20% more than the current rate in the inventory table which has the following fields: Prono, ProName and Rate. After updating the table a new field (Alter) called for Number of item and place for values for the new field without using PL/SQL block
10. Write a PL/SQL to split the student table into two tables based on result (One table for Pass and another for Fail). Use a cursor for handling records of the student table. Assume necessary fields and create a student details table
11. Create a database trigger on master and transaction tables which are based on an inventory management system for checking data validity. Assume the necessary fields for both tables
12. Construct a PL/SQL program to raise an Exception in the Bank Account Management table when the deposit amount is zero.
